

OPERATOR'S MANUAL

10 in. (254 mm) TABLE SAW

BTS15

Your new Table Saw has been engineered and manufactured to Ryobi's high standards for dependability, ease of operation, and operator safety. Properly cared for, it will give you years of rugged, trouble-free performance.

WARNING: To reduce the risk of injury, the user must read and understand the operator's manual before using this product.

Thank you for buying a Ryobi Table Saw.

RULES FOR SAFE OPERATION

The purpose of safety symbols is to attract your attention to possible dangers. The safety symbols, and the explanations with them, deserve your careful attention and understanding. The safety warnings do not by themselves eliminate any danger. The instructions or warnings they give are not substitutes for proper accident prevention measures.

Symbol	Meaning
--------	---------

	DANGER: Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.
--	---------------------------------------------------------------------------------------------------------------------------

	WARNING: Indicates a potentially hazardous situation which, if not avoided, could result in serious injury.
--	--------------------------------------------------------------------------------------------------------------------

	CAUTION: Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices that may cause property damage.
--	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

NOTE:	Advises you of information or instructions vital to the operation or maintenance of the equipment.
--------------	----------------------------------------------------------------------------------------------------

IMPORTANT

Servicing requires extreme care and knowledge and should be performed only by a qualified service technician. For service we suggest you return the tool to your nearest Ryobi **AUTHORIZED SERVICE CENTER** for repair. When servicing, use only identical Ryobi replacement parts.

WARNING:

Observe all normal safety precautions related to avoiding electrical shock.

WARNING:

Do not attempt to use the tool until you read thoroughly and understand completely the operator's manual. Pay close attention to the safety rules, including Dangers, Warnings, and Cautions. If you use this tool properly and only for what it is intended, you will enjoy years of safe, reliable service.

WARNING:

The operation of any power tool can result in foreign objects being thrown into your eyes, which can result in severe eye damage. Before beginning tool operation, always wear safety goggles or safety glasses with side shields and a full face shield when needed. We recommend Wide Vision Safety Mask for use over eyeglasses or standard safety glasses with side shields. Always wear eye protection which is marked to comply with ANSI Z87.1.

Look for this symbol to point out important safety precautions. It means attention!!! Your safety is involved.

RULES FOR SAFE OPERATION

Safe operation of this power tool requires that you read and understand this operator's manual and all labels affixed to the tool. Safety is a combination of common sense, staying alert, and knowing how your table saw works.

READ ALL INSTRUCTIONS

- **KNOW YOUR POWER TOOL.** Read the operator's manual carefully. Learn the saw's applications and limitations as well as the specific potential hazards related to this tool.
- **GUARD AGAINST ELECTRICAL SHOCK BY PREVENTING BODY CONTACT WITH GROUNDED SURFACES.** For example; pipes, radiators, ranges, refrigerator enclosures.
- **KEEP GUARDS IN PLACE** and in working order. Never operate the tool with any guard or cover removed. Make sure all guards are operating properly before each use.
- **REMOVE ADJUSTING KEYS AND WRENCHES.** Form habit of checking to see that keys and adjusting wrenches are removed from tool before turning it on.
- **KEEP WORK AREA CLEAN.** Cluttered areas and benches invite accidents. **DO NOT** leave tools or pieces of wood on the saw while it is in operation.
- **AVOID DANGEROUS ENVIRONMENT.** Don't use power tools in damp or wet locations or expose to rain. Keep work area well lit.
- **KEEP CHILDREN AND VISITORS AWAY.** All visitors should wear safety glasses and be kept a safe distance from work area. Do not let visitors contact tool or extension cord while operating.
- **MAKE WORKSHOP CHILDPROOF** with padlocks or master switches, or by removing starter keys.
- **DON'T FORCE TOOL.** It will do the job better and safer at the feed rate for which it was designed.
- **USE RIGHT TOOL.** Don't force tool or attachment to do a job it was not designed for. Don't use it for a purpose not intended.
- **MAKE SURE YOUR EXTENSION CORD IS IN GOOD CONDITION.** When using an extension cord, be sure to use one heavy enough to carry the current your product will draw. An undersized cord will cause a drop in line voltage resulting in loss of power and overheating. A wire gage size (A.W.G.) of at least 14 is recommended for an extension cord 25 feet or less in length. If in doubt, use the next heavier gage. The smaller the gage number, the heavier the cord.
- **DRESS PROPERLY.** Do not wear loose clothing, gloves, neckties, or jewelry. They can get caught and draw you into moving parts. Rubber gloves and nonskid footwear are recommended when working outdoors. Also wear protective hair covering to contain long hair.
- **ALWAYS WEAR SAFETY GLASSES WITH SIDE SHIELDS.** Everyday eyeglasses have only impact-resistant lenses; they are **NOT** safety glasses.
- **SECURE WORK.** Use clamps or a vise to hold work when practical. It's safer than using your hand and frees both hands to operate tool.
- **DON'T OVERREACH.** Keep proper footing and balance at all times.
- **MAINTAIN TOOLS WITH CARE.** Keep tools sharp and clean for better and safer performance. Follow instructions for lubricating and changing accessories.
- **DISCONNECT TOOLS.** When not in use, before servicing, or when changing attachments, blades, bits, cutters, etc., all tools should be disconnected.
- **AVOID ACCIDENTAL STARTING.** Be sure switch is off when plugging in.
- **USE RECOMMENDED ACCESSORIES.** The use of improper accessories may cause risk of injury.
- **NEVER STAND ON TOOL.** Serious injury could occur if the tool is tipped or if the cutting tool is unintentionally contacted.
- **CHECK DAMAGED PARTS.** Before further use of the tool, a guard or other part that is damaged should be carefully checked to determine that it will operate properly and perform its intended function. Check for alignment of moving parts, binding of moving parts, breakage of parts, mounting and any other conditions that may affect its operation. A guard or other part that is damaged must be properly repaired or replaced by an authorized service center to avoid risk of personal injury.
- **USE THE RIGHT DIRECTION OF FEED.** Feed work into a blade or cutter against the direction of rotation of blade or cutter only.
- **NEVER LEAVE TOOL RUNNING UNATTENDED. TURN POWER OFF.** Don't leave tool until it comes to a complete stop.
- **PROTECT YOUR LUNGS.** Wear a face or dust mask if the cutting operation is dusty.
- **PROTECT YOUR HEARING.** Wear hearing protection during extended periods of operation.
- **DON'T ABUSE CORD.** Never yank cord to disconnect from receptacle. Keep cord from heat, oil, and sharp edges.
- **USE OUTDOOR EXTENSION CORDS.** When tool is used outdoors, use only extension cords with approved ground connection that are intended for use outdoors and so marked.
- **ALWAYS KEEP THE BLADE GUARD AND SPREADER (SPLITTER) IN PLACE** and in working order.
- **KEEP BLADES CLEAN AND SHARP.** Sharp blades minimize stalling and kickback.
- **KEEP HANDS AWAY FROM CUTTING AREA.** Keep hands away from blades. Do not reach underneath work or around or over the blade while blade is rotating. Do not attempt to remove cut material when blade is moving.

RULES FOR SAFE OPERATION

- **BLADES COAST AFTER TURN OFF.**
- **NEVER USE IN AN EXPLOSIVE ATMOSPHERE.** Normal sparking of the motor could ignite fumes.
- **INSPECT TOOL CORDS PERIODICALLY.** If damaged, have repaired by a qualified service technician at an authorized service facility. The conductor with insulation having an outer surface that is green with or without yellow stripes is the equipment-grounding conductor. If repair or replacement of the electric cord or plug is necessary, do not connect the equipment-grounding conductor to a live terminal. Repair or replace a damaged or worn cord immediately. Stay constantly aware of cord location and keep it well away from the rotating blade.
- **INSPECT EXTENSION CORDS PERIODICALLY** and replace if damaged.
- **KEEP TOOL DRY, CLEAN, AND FREE FROM OIL AND GREASE.** Always use a clean cloth when cleaning. Never use brake fluids, gasoline, petroleum-based products, or any solvents to clean tool.
- **STAY ALERT AND EXERCISE CONTROL.** Watch what you are doing and use common sense. Do not operate tool when you are tired. Do not rush.
- **DO NOT USE TOOL IF SWITCH DOES NOT TURN IT ON AND OFF.** Have defective switches replaced by an authorized service center.
- **GUARD AGAINST KICKBACK.** Kickback occurs when the blade stalls rapidly and workpiece is driven back towards the operator. It can pull your hand into the blade resulting in serious personal injury. Stay out of blade path and turn switch off immediately if blade binds or stalls.
- **USE RIP FENCE.** Always use a fence or straight edge guide when ripping.
- **SUPPORT LARGE PANELS.** To minimize risk of blade pinching and kickback, always support large panels.
- **BEFORE MAKING A CUT, BE SURE ALL ADJUSTMENTS ARE SECURE.**
- **USE ONLY CORRECT BLADES.** Do not use blades with incorrect size holes. Never use blade washers or bolts that are defective or incorrect. The maximum blade capacity of your saw is 10 in. (254 mm).
- **AVOID CUTTING NAILS.** Inspect for and remove all nails from lumber before cutting.
- **NEVER TOUCH BLADE** or other moving parts during use.
- **NEVER START A TOOL WHEN ANY ROTATING COMPONENT IS IN CONTACT WITH THE WORKPIECE.**
- **DO NOT OPERATE THIS TOOL WHILE UNDER THE INFLUENCE OF DRUGS, ALCOHOL, OR ANY MEDICATION.**
- **GROUND ALL TOOLS.** If tool is equipped with three-prong plug, it should be plugged into a three-hole electrical receptacle.
- **WHEN SERVICING** use only identical Ryobi replacement parts. Use of any other parts may create a hazard or cause product damage.
- **REMOVE ALL FENCES AND AUXILIARY TABLES** before transporting saw. Failure to do so can result in an accident causing possible serious personal injury.
- **ALWAYS USE BLADE GUARD, SPREADER, AND ANTI-KICKBACK PAWLS** on all "through-sawing" operations. Through-sawing operations are those in which the blade cuts completely through the workpiece as in ripping or crosscutting. Keep the blade guard down, the anti-kickback pawls down, and the spreader in place over the blade.
- **ALWAYS SECURE WORK** firmly against rip fence or miter fence.
- **ALWAYS USE A PUSH STICK FOR RIPPING NARROW STOCK.** A push stick is a device used to push a workpiece through the blade instead of using your hands. Size and shape can vary but the push stick must always be narrower than the workpiece to prevent the push stick from contacting the saw blade. When ripping narrow stock, always use a push stick, so your hand does not come close to the saw blade. Use a featherboard and push blocks for non-through cuts.
- **NEVER** perform any operation "freehand" which means using only your hands to support or guide the workpiece. Always use either the rip fence or miter fence to position and guide the work.
- **NEVER** stand or have any part of your body in line with the path of the saw blade.
- **NEVER** reach behind, over, or within three inches of the blade or cutter with either hand for any reason.
- **MOVE THE RIP FENCE** out of the way when crosscutting.
- **NEVER** use rip fence as cutoff gage when crosscutting.
- **NEVER** attempt to free a stalled saw blade without first turning the saw **OFF** and disconnecting the saw from the power source.
- **PROVIDE ADEQUATE SUPPORT** to the rear and sides of the saw table for wide or long workpieces. Use a sturdy "outrigger" support if a table extension more than 24 inches long is attached to the saw.
- **AVOID KICKBACKS** (work thrown back toward you) by:
 - A. Keeping blade sharp.
 - B. Keeping rip fence parallel to the saw blade.
 - C. Keeping spreader, anti-kickback pawls, and blade guard in place and operating.
 - D. Not releasing the work before it is pushed all the way past the saw blade using a push stick.
 - E. Not ripping work that is twisted or warped or does not have a straight edge to guide along the fence.
- **AVOID AWKWARD OPERATIONS AND HAND POSITIONS** where a sudden slip could cause your hand to move into the cutting tool.

RULES FOR SAFE OPERATION

- **CHECK WITH A QUALIFIED ELECTRICIAN** or service personnel if the grounding instructions are not completely understood or if in doubt as to whether the tool is properly grounded.
- **DO NOT MODIFY** the plug provided. If it will not fit the outlet, have the proper outlet installed by a qualified electrician.
- **USE ONLY RECOMMENDED ACCESSORIES** listed in this manual or addendums. Blades must be rated for at least 5,500 rpm. Use of accessories that are not listed may cause the risk of personal injury. Instructions for safe use of accessories are included with the accessory.
- **DOUBLE CHECK ALL SETUPS.** Make sure blade is tight and not making contact with saw or workpiece before connecting to power supply.
- **MAKE SURE THE WORK AREA HAS AMPLE LIGHTING** to see the work and that no obstructions will interfere with safe operation **BEFORE** performing any work using the table saw.
- **ALWAYS TURN OFF SAW** before disconnecting it, to avoid accidental starting when reconnecting to power supply.

- **SAVE THESE INSTRUCTIONS.** Refer to them frequently and use to instruct other users. If you loan someone this tool, loan them these instructions also.

WARNING:

Some dust created by power sanding, sawing, grinding, drilling, and other construction activities contains chemicals known to cause cancer, birth defects or other reproductive harm. Some examples of these chemicals are:

- lead from lead-based paints,
- crystalline silica from bricks and cement and other masonry products, and
- arsenic and chromium from chemically-treated lumber.

Your risk from these exposures varies, depending on how often you do this type of work. To reduce your exposure to these chemicals: work in a well ventilated area, and work with approved safety equipment, such as those dust masks that are specially designed to filter out microscopic particles.

SAFETY AND INTERNATIONAL SYMBOLS

This operator's manual describes safety and international symbols and pictographs that may appear on this product. Read the operator's manual for complete safety, assembly, operating and maintenance, and repair information.

SYMBOL

MEANING

- Do not expose to rain or use in damp locations.

NO HANDS SYMBOL

- Failure to keep your hands away from the blade will result in serious personal injury.

SAVE THESE INSTRUCTIONS

ELECTRICAL

DOUBLE INSULATION

Double insulation is a concept in safety in electric power tools, which eliminates the need for the usual three-wire grounded power cord. All exposed metal parts are isolated from the internal metal motor components with protecting insulation. Double insulated tools do not need to be grounded.

WARNING:

The double insulated system is intended to protect the user from shock resulting from a break in the tool's internal insulation. Observe all normal safety precautions to avoid electrical shock.

Important: Servicing of a tool with double insulation requires extreme care and knowledge of the system and should be performed only by a qualified service technician. For service, we suggest you return the tool to your nearest authorized service center for repair. Always use original factory replacement parts when servicing.

ELECTRICAL CONNECTION

The saw has a precision-built electric motor. It should be connected to a power supply that is 120 volts, 60 Hz, AC only (normal household current). Do not operate this tool on direct current (DC). A substantial voltage drop will cause a loss of power and the motor will overheat. If your tool does not operate when plugged into an outlet, double-check the power supply.

EXTENSION CORDS

When using a power tool at a considerable distance from a power source, be sure to use an extension cord that has the capacity to handle the current the tool will draw. An undersized cord will cause a drop in line voltage, resulting in overheating and loss of power. Use the chart to determine the minimum wire size required in an extension cord. Only round jacketed cords listed by Underwriter's Laboratories (UL) should be used.

When working outdoors with a tool, use an extension cord that is designed for outside use. This type of cord is designated with "WA" on the cord's jacket.

Before using any extension cord, inspect it for loose or exposed wires and cut or worn insulation.

****Ampere rating (on tool faceplate)**

0-2.0 2.1-3.4 3.5-5.0 5.1-7.0 7.1-12.0 12.1-16.0

Cord Length	Wire Size (A.W.G.)					
	0-2.0	2.1-3.4	3.5-5.0	5.1-7.0	7.1-12.0	12.1-16.0
25'	16	16	16	16	14	14
50'	16	16	16	14	14	12
100'	16	16	14	12	10	—

****Used on 12 gauge - 20 amp circuit.**

CAUTION:

Keep the extension cord clear of the working area. Position the cord so that it will not get caught on lumber, tools or other obstructions while you are working with a power tool. Failure to do so can result in serious personal injury.

WARNING:

Check extension cords before each use. If damaged replace immediately. Never use tool with a damaged cord since touching the damaged area could cause electrical shock resulting in serious injury.

GLOSSARY OF TERMS

Anti-Kickback Pawls (Fingers)

Device which, when properly installed and maintained, is designed to stop the workpiece from being kicked back toward the front of the saw during a ripping operation.

Arbor

The shaft on which a blade or cutting tool is mounted.

Bevel Cut

A cutting operation made with an angled blade.

Compound Cut

A cut with both a miter angle and a bevel angle.

Crosscut

A cutting or shaping operation made across the grain of the workpiece.

Dado

A non-through cut which produces a square sided notch or trough in the workpiece.

Featherboard

A device used to help control the workpiece by guiding it securely against the table or fence during any rip cut operation.

Freehand

Performing a cut without using a fence, miter gauge, fixture, hold down clamp, or other proper device to keep the workpiece from twisting during the cut.

Gum

A sticky, sap based residue from wood products.

Heel

Misalignment of the blade.

Kerf

The amount of material removed by the blade in a through cut or the slot produced by the blade in a non-through or partial cut.

Kickback

An uncontrolled grabbing and throwing of the workpiece back toward the front of the saw. Associated with the workpiece closing the kerf and pinching the blade or otherwise placing tension on the blade.

Leading End

The end of the workpiece which, during a rip type operation, is pushed into the cutting tool first.

Miter Cut

A cutting operation made with the wood at any angle other than 90 degrees.

Molding

A cut which produces a special shape in the workpiece, used for joining or decoration.

Non-Through Cuts

Any cutting operation where the blade does not extend completely through the thickness of the workpiece.

Push Block

A device used to feed the workpiece through the saw, except during narrow ripping type operations where a push stick should be used. It also helps keep the operator's hands well away from the blade.

Push Stick

A device used to feed the workpiece through the saw to help keep the operator's hands well away from the blade.

Rabbet

A notch in the edge of a workpiece.

Resin

A sticky, sap base substance that has hardened.

Ripping Or Rip Cut

A cutting or shaping operation made along the length or with the grain of the workpiece.

Riving Knife/Spreader/Splitter

A metal piece, slightly thinner than the saw blade which helps keep the kerf open and prevent kickback.

Revolutions Per Minute (RPM)

The number of turns completed by a spinning object in one minute.

Saw Blade Path

The area over, under, behind, or in front of the blade. As it applies to the workpiece, that area which will be, or has been, cut by the blade.

Set

The distance that the tip of the saw blade tooth is bent (or set) outward from the face of the blade.

Throw-Back

Throwing of a workpiece in a manner similar to a kickback. Usually associated with a cause other than the kerf closing, such as a workpiece being dropped onto the blade or being placed inadvertently in contact with the blade.

Through Sawing

Any cutting operation where the blade extends completely through the thickness of the workpiece.

Trailing End

The workpiece end last cut by the blade in a ripping operation.

Workpiece

The item on which the cutting operation is being done. The surfaces of a workpiece are commonly referred to as faces, ends, and edges.

UNPACKING

Your Model BTS15 Table Saw is shipped complete in one carton and includes a rip fence, a miter fence, and a blade guard.

Separate all parts from packing materials and check each one with the illustration and the list of Loose Parts to make sure all items are accounted for before discarding any packing material.

Important: Remove the foam block from between the saw's housing and the motor.

If any parts are missing, do not attempt to assemble the table saw, plug in the power cord, or turn the switch on until the missing parts are obtained and are installed correctly. Call 1-800-525-2579 for assistance if any parts are missing or damaged.

The saw is factory set for accurate cutting. After assembling it, check for accuracy. If shipping has influenced the settings, refer to specific procedures explained in the operation and maintenance sections of this manual.

WARNING:

If any parts are missing, do not operate this tool until the missing parts are replaced. Failure to do so could result in possible serious personal injury.

I. Upper Brace	2		

FEATURES

Your saw is designed to perform as a versatile, accurate, precision cutting tool that is easy to operate.

It is equipped with the following features for convenience, ease of use, and high-quality performance:

- a combination saw blade
- a bevel indicator to set the exact angle of the blade, with locking lever
- an adjustable sliding miter table
- an adjustable miter fence
- an adjustable rip fence with scale indicator
- an adjustable riving knife (splitter) and blade guard with anti-kickback pawls
- front and rear guide rails with an easy-to-read scale on front rail

- blade adjusting handle to set depth of cut
- a sliding outfeed support
- switch with removable switch key to help prevent unauthorized use
- leg stand for ease of operation

These features provide ease of cutting with all types of wood.

WARNING:

Before attempting to use your table saw, familiarize yourself with all operating features and safety requirements.

GETTING TO KNOW YOUR SAW

Fig. 4

FEATURES

WARNING:

Although some of the illustrations in this manual are shown with the blade guard removed for clarity, do not operate the saw without the blade guard unless specifically instructed to do so.

OPERATING COMPONENTS

The upper portion of the blade projects up through the table, surrounded by an insert called the throat plate. To cut wood at a bevel, the blade must be tilted, using the bevel handle, scale, and bevel indicator found on the front of the cabinet. Inside the cabinet, adjustable positive stops are provided for 0° and 45°.

Your saw includes a rip fence and miter fence with under table storage for easy accessibility. The rip fence is used to position work that will be cut lengthwise. A scale on the front rail shows the distance between the rip fence and the blade.

The leg stand places the table saw at convenient working level.

The blade guard assembly includes a riving knife which is a metal device directly behind and above the blade. It is used to help keep the cut wood from binding together and causing possible kickback. It is very important to use the riving knife for all through-sawing operations. The anti-kickback pawls (also a part of the blade guard assembly) are toothed plates mounted on the riving knife. Their teeth point away from the work in case the work should be pulled back, toward the operator. Then the teeth dig into the wood to help prevent or reduce the possibility of kickback.

POWER SWITCH

Your table saw is equipped with a power switch that has a built-in locking feature. This feature is intended to prevent unauthorized and possible hazardous use by children and others.

TO TURN YOUR SAW ON:

1. With the switch key inserted into the switch, lift the switch button to turn on ().

TO TURN YOUR SAW OFF:

1. Press the switch button down to turn off ().

TO LOCK YOUR SAW :

1. Press the switch button down.
2. Remove the switch key from the switch and store in a safe, secure location.

WARNING:

Always remove the switch key when the tool is not in use and keep it in a safe place. In the event of a power failure, turn the switch off () and remove the key. This action will prevent the tool from accidentally starting when power returns.

WARNING:

ALWAYS make sure your workpiece is not in contact with the blade before operating the switch to start the tool. Failure to heed this warning may cause the workpiece to be kicked back toward the operator and result in serious personal injury.

WARNING:

To reduce the risk of accidental starting, ALWAYS make sure the switch is in the off () position before plugging tool into the power source.

Fig. 5

FEATURES

BLADES

It is recommended that you use a RYOBI 10 in. (254 mm) Combination Blade, which is provided with the BTS15 Table Saw. You will get maximum performance with the following features:

- 36 precision ground, micro-grain carbide teeth
- kerf width of 2.7 mm \pm .02
- tensioning for 4,800 rpm

This blade is provided with the saw. Additional blade styles of the same high quality are available for specific operations such as ripping. Your local RYOBI dealer can provide you with complete information.

CAUTION:

Be sure to use only blades that are rated for at least 5,500 RPM and recommended for use on this saw.

PRECISION GROUND
MICRO-GRAIN
CARBIDE TEETH

BLADE
ROTATION

Fig. 6

SPEED AND WIRING

The no-load speed of your table saw is approximately 4,800 rpm. The speed will not remain constant but will be less under a load. The wiring in a shop is as important as the motor's horsepower rating. A line intended for lights only **WILL NOT PROPERLY CARRY A POWER TOOL MOTOR**. Wire that is heavy enough for a short distance will be too light for a greater distance. A line that can support one power tool may not be able to support two or three tools.

WARNING:

To prevent possible electrical hazards, have a qualified electrician check the line if you are not certain that it is properly wired.

PRODUCT SPECIFICATIONS

Blade Diameter 10 in. (254 mm)
Blade Arbor 5/8 in. (16 mm)
Cutting Depth at 0° 3-9/16 in. (90 mm)
Cutting Depth at 45° 2-1/2 in. (63.5 mm)

Rating 120 Volts, 60 Hz-AC Only, 15 Amperes
Output Speed 4,800/min.
Net Weight 85 lbs. (38.5 kg.)

ASSEMBLY

Assembly is best done in the area where the saw will be used. When you remove the table saw base, loose parts, and hardware from the packing materials, check all items with the loose parts list and drawing. If you are unsure about the description of any part, refer to the drawing. If any parts are missing, delay assembling until you have obtained the missing part(s).

ASSEMBLING LEG STAND

See Figures 7 and 8.

- Take the following hardware from the leg stand hardware bag:

24 carriage bolts (5/16-18 x 5/8 in.)

1 leveling foot

6 flat washers (5/16 in.)

28 hex nuts (5/16-18)

3 feet

Note: Remaining hardware from this bag is used for mounting leg stand on the table saw base and mounting the storage bracket to the upper brace.

- Take 4 legs and 8 braces from loose parts.
- Place an upper side brace inside leg with the leg's wide end up.

Note: Upper braces have large holes in each end; these holes should be on top when leg stand is completely assembled as shown in figure 8.

- Align the holes on the brace and the legs. Insert two carriage bolts and hand tighten using hex nuts. These are the front and back sets.
- For the side sets, install an upper brace on two legs. Add hardware and finger tighten. Repeat for the other upper brace.
- Use the same steps to install the lower braces. Tighten all hex nuts with a wrench.
- Place a hex nut and flat washer on the leveling foot. Install the leveling foot from the bottom of the leg with the bolts pointing up. Cap with the remaining flat washer and hex nut but do not tighten.
- Place one foot on the bottom of each of the remaining three legs.
- Move the leg set to desired location. Adjust the leveling foot with a wrench, then tighten the top hex nut.

ASSEMBLING STORAGE BRACKETS

- Take storage brackets from loose parts.
- Take the following hardware from the leg stand hardware bag:
 - 2 screws (1/4-20 x 1/2 in. Pan Hd.)
 - 2 hex nuts (1/4-20)
 - 2 washers (1/4 in.)
- Secure storage brackets to upper braces of leg stand as shown in figure 7.

Fig. 7

Fig. 8

ASSEMBLY

TO MOUNT THE TABLE SAW TO THE LEG STAND

See Figure 9.

- Take the following from a small hardware bag:

4 hex bolts (5/16-18 x 2 in.)
4 hex nuts, flanged (5/16-18)
4 flat washers (5/16 in.)

Note: This hardware was in the bag with hardware for assembling the leg stand.

WARNING:

The saw base is heavy. Do not lift the saw without help. When lifting, lift close to your body. Keep your knees bent and lift with your legs, not your back. Ignoring these precautions can result in back injury.

- Place the table saw on the leg stand. Align the holes in the table saw base with the holes in the upper braces.
- Place a flat washer on a hex bolt and insert through hole. Add a flanged hex nut. Hand tighten. See Figure 9.
- Repeat for three remaining holes. Tighten all hardware with a wrench. You may find it helpful to use one wrench to hold the head of the hex bolt and one to tighten the hex nut.

WARNING:

Do not connect to power supply until assembly is complete. Failure to comply could result in accidental starting and possible serious injury.

TO INSTALL THE BLADE ADJUSTING HANDLE

See Figure 10.

The blade adjusting handle mounts to the bevel handle with a screw (M4 x 10 mm) and a flat washer.

- Align blade adjusting handle to the shaft end that extends from the front of the table saw base. Match the flat spots on the shaft with the flats inside the blade adjusting handle. Insert a screw and a flat washer in the center of the blade adjusting handle and tighten.

Fig. 9

Fig. 10

ASSEMBLY

TO INSTALL RIP FENCE

See Figure 11.

To install the rip fence, place the rear lip on the rear rail and pull slightly toward the front of the unit. Lower front end onto the guide surfaces on top of the front rail. Check for a smooth gliding action. Swing the locking handle down to automatically align and secure the fence.

TO INSTALL MITER TABLE

See Figure 12.

- Remove the solid table extension by turning the table lock knob counterclockwise.
- Lift the solid table extension.
- Place the sliding miter table in the slot where the solid table extension had been.
- Retighten table lock knobs.

TO LOCK MITER TABLE

See Figure 13.

The miter table slides to let the operator slide the workpiece across the saw. A miter slide lock is mounted on the front of the miter table to lock it in place. The miter slide lock is placed in a slot on the base to align the miter table with the front edge of the saw table. The sliding miter table should be locked for any cut in which the operator prefers a fixed table.

- To lock the miter table with the base projecting to the front, place miter slide lock in the back slot on the base.
- To lock the miter table with the base projecting to the back, place miter slide lock in the front slot on the base.

Fig. 11

Fig. 12

Fig. 13

ASSEMBLY

BLADE AND GUARD ASSEMBLY

WARNING:

Do not connect to power supply until assembly is complete. Failure to comply could result in accidental starting and possible serious injury.

TO CHECK SAW BLADE INSTALLATION

- To check the saw blade, first lower the blade and remove the screw holding the throat plate in place. Remove the throat plate. *See Figure 14.*
- Make sure the bevel locking lever is locked. Raise the blade arbor to its full height by turning the blade adjusting handle counterclockwise.
- Using the smaller wrench, insert the flat open end into the flats on the arbor shaft as shown. Insert the larger wrench over the flange nut, and, holding both wrenches firmly, pull the larger wrench forward to the front of the machine to loosen and push to tighten. Make sure the flange nut is securely tightened. Do not overtighten.

Note: Arbor shaft has right-hand threads.

- Check all clearances for free blade rotation.
- Lower the blade by turning the blade adjustment handle clockwise.
- Reinstall the throat plate.

TO INSTALL BLADE GUARD ASSEMBLY

- Lower the blade by turning the blade adjustment handle clockwise.
- Using an adjustable wrench, install the blade guard assembly by loosening the two attachment nuts enough to attach the separator (align holes and tabs). *See Figure 15.* Partially retighten the two attachment nuts. Check the blade and separator alignment.
- Correctly align the blade and separator as shown, repeating above step as needed. Tighten attachment nuts securely. If separator is not positioned correctly with blade up, it could contact saw table when blade is lowered and restrict blade elevation.

Fig. 14

Fig. 15

Fig. 16

OPERATION

BASIC OPERATION OF THE TABLE SAW

A table saw can be used for straight-line cutting operations such as cross cutting, ripping, mitering, beveling, and compound cutting. It can dado with optional accessories.

The 2-prong plug must be plugged into a matching outlet that is properly installed and grounded according to all local codes and ordinances. Improper connection of the equipment can result in electric shock. Check with an electrician or service personnel if you are unsure about proper grounding. Do not modify the plug; if it will not fit the outlet, have the correct outlet installed by a qualified electrician. Refer to the *Electrical* page of this manual.

Note: This table saw is designed to cut wood and wood composition products only.

CAUSES OF KICKBACK

Kickback can occur when the blade stalls or binds, kicking the workpiece back toward you with great force and speed. If your hands are near the saw blade, they may be jerked loose from the workpiece and may contact the blade. Obviously, kickback can cause serious injury, and it is well worth using precautions to avoid the risks.

Kickback can be caused by any action that pinches the blade in the wood, such as the following:

- Making a cut with incorrect blade depth
- Sawing into knots or nails in the workpiece
- Twisting the wood while making a cut
- Failing to support work
- Forcing a cut
- Cutting warped or wet lumber
- Using the wrong blade for the type of cut
- Not following correct operating procedures
- Misusing the saw
- Failing to use the anti-kickback pawls
- Cutting with a dull, gummed-up, or improperly set blade

AVOIDING KICKBACK

- Always use the correct blade depth setting. The top of the blade teeth should clear the workpiece by 1/8 in. to 1/4 in.
- Inspect the work for knots or nails before beginning a cut. Knock out any loose knots with a hammer. Never saw into a loose knot or nail.
- Always use the rip fence when rip cutting and the miter gauge when cross cutting. This helps prevent twisting the wood in the cut.
- Always use clean, sharp, and properly-set blades. Never make cuts with dull blades.
- To avoid pinching the blade, support the work properly before beginning a cut.
- When making a cut, use steady, even pressure. Never force cuts.
- Do not cut wet or warped lumber.
- Always hold your workpiece firmly with both hands or with pushsticks. Keep your body in a balanced position to be ready to resist kickback should it occur. Never stand directly in line with the blade.

- Use the right type of blade for the cut being made.
- Use the blade guard assembly for all through cuts.

CUTTING AIDS

See Figure 17.

Push sticks are devices used for safely pushing a workpiece through the blade instead of using your hands. They can be made in various sizes and shapes from scrap wood to use in a specific project. The stick must be narrower than the workpiece, with a 90° notch in one end and shaping for a grip on the other end.

A push block has a handle fastened by recessed screws from the underside. Use it on non-through cuts.

CAUTION:

Be sure the screw is recessed to avoid damaging the saw or workpiece.

Fig. 17

WARNING:

Never stand directly in line with the blade or allow hands to come closer than 3 in. to the blade. Do not reach over or across the blade. Failure to heed this warning can result in serious personal injury.

CUTTING TIPS

Dado and rabbet cuts are non-through cuts which can be either rip cuts or cross cuts. Carefully read and understand all sections of this operator's manual before attempting any operation.

WARNING:

All blades and dado sets must be rated for at least 5,500 RPM to prevent possible injury.

OPERATION

FEATHERBOARD

A featherboard is a device used to help control the workpiece by guiding it securely against the table or fence. Featherboards are especially useful when ripping small workpieces and for completing non-through cuts. The end is angled, with a number of short kerfs to give a friction hold on the workpiece. Lock it in place on the table with a C-clamp. Test that it could resist kickback.

WARNING:

Place the featherboard against the uncut portion of the workpiece, to avoid kickback that could cause serious personal injury.

HOW TO MAKE A FEATHERBOARD

See Figure 19.

The featherboard is an excellent project for your BTS15. Select a solid piece of lumber approximately 3/4 in. thick, 3-5/8 in. wide and 18 in. long. Mark the center of the width on one end of the stock. Miter one-half of the width to 30° and miter the other half of the same end to 45°. See page 24 for information on miter cuts. Mark the board from the point at 6 in., 8 in., 10 in. and 12 in. Drill a 3/8 in. hole at the 8 in., 10 in., and 12 in. marks. Set the rip fence to allow approximately a 1/4 in. "finger" to be cut in the stock. Feed the stock only to the mark previously made at 6 in. Turn the saw **OFF** and allow the blade to completely stop rotating before removing the stock. Reset the rip fence and cut spaced rips into the workpiece to allow approximately 1/4 in. fingers and 1/8 in. spaces between the fingers.

HOW TO MOUNT A FEATHERBOARD

Remove the adjusting clamp knob, bolt and washer from the Miter Fence Holder. Place the bolt through one of the holes

in the featherboard. Positioning the featherboard will depend on the placement of the bolt. Place the washer on the bolt and attach the adjusting clamp knob, loosely. Position the featherboard with the hex head of the bolt in the miter table slot but do not tighten. Completely lower the saw blade. Position the rip fence to the desired adjustment for the cut to be performed and lock. Place the workpiece against the fence and over the saw blade area. Adjust the featherboard to apply resistance to the workpiece just forward of the blade. Securely tighten the adjusting clamp knob to secure the featherboard in place. Attach a C-clamp to further secure the featherboard to the edge of the sliding miter table.

WARNING:

DO NOT locate the featherboard to the rear of the workpiece. Kickback can result from the featherboard pinching the workpiece and binding the blade in the saw kerf if positioned improperly. Failure to heed this warning can result in serious personal injury.

Fig. 18

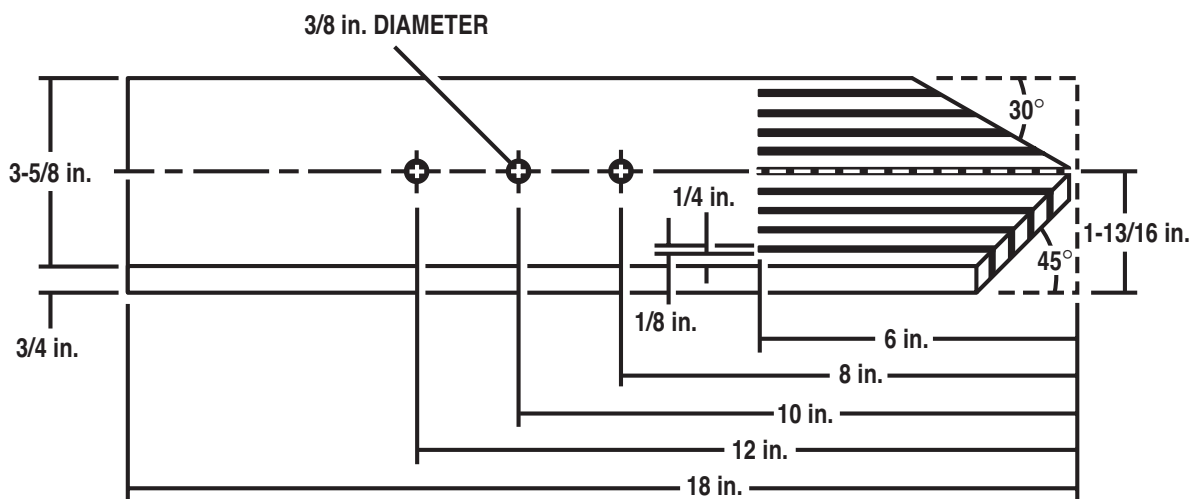

Fig. 19

OPERATION

- The kerf (the cut made by the blade in the wood) will be wider than the blade to avoid overheating or binding. Make allowance for the kerf when measuring wood.
- Make sure the kerf is made on the waste side of the measuring line.
- Cut the wood with the finish side up.
- Knock out any loose knots with a hammer before making the cut.
- Always provide proper support for the wood as it comes out of the saw.

TYPES OF CUTS

See Figure 20.

There are six basic cuts: 1) the cross cut, 2) the rip cut, 3) the miter cut, 4) the bevel cross cut, 5) the bevel rip cut, and 6) the compound (bevel) miter cut. All other cuts are combinations of these basic six. Operating procedures for making each kind of cut are given later in this section.

WARNING:

Always make sure the blade guard and anti-kickback pawls are in place and working properly when making these cuts to avoid possible injury.

Cross cuts are straight 90° cuts made across the grain of the workpiece. The wood is fed into the cut at a 90° angle to the blade, and the blade is vertical.

Rip cuts are made with the grain of the wood. To avoid kickback while making a rip cut, make sure one side of the wood rides firmly against the rip fence.

Miter cuts are made with the wood at any angle to the blade other than 90°. The blade is vertical.

WARNING:

Always use a push stick with small pieces of wood, and also to finish the cut when ripping a long narrow piece of wood, to prevent your hands from getting close to the blade.

Bevel cuts are made with an angled blade. Bevel cross cuts are across the wood grain, and bevel rip cuts are with the grain. The rip fence must always be on the left side of the blade for bevel rip cuts.

Compound (or bevel) miter cuts are made with an angled blade on wood that is angled to the blade. Be thoroughly familiar with making cross cuts, rip cuts, bevel cuts, and miter cuts before trying a compound miter cut.

Fig. 20

WARNING:

All blades must be rated for at least 5,500 rpm to prevent possible injury.

OPERATION

TO ADJUST THE BLADE DEPTH

The blade depth should be set so that the outer points of the blade are higher than the workpiece by approximately 1/8 in. to 1/4 in. but the lowest points (gullets) are below the top surface. See Figure 21.

WARNING:

Unplug the saw and make sure the blade guard assembly is installed and working properly to avoid serious personal injury.

- Raise the blade by turning the blade adjusting handle counterclockwise or lower it by turning the handle clockwise.

TO ADJUST THE BLADE ANGLE

See Figure 22.

WARNING:

Unplug the saw and make sure the blade guard assembly is installed and working properly to avoid serious personal injury.

- Unlock the bevel locking lever.
- Angle the blade by turning the bevel handle until the bevel indicator shows the correct angle.
- Lock the bevel locking lever securely while holding the bevel handle in place.

TO SET THE SCALE TO THE BLADE

The scale is usable from 5/8 in.-20 in. (16 mm-686 mm) to the right side of the blade and 0-7 in. (0-178 mm) on the left side of the blade. The operator can select any desired dimension within those ranges. Use the following steps to set the scale to the blade and scale indicator. Begin with the blade at a zero angle (straight up).

- Loosen the rip fence by raising the locking handle.
- Using a framing square, set the rip fence 2 in. from the blade tip edge.
- Loosen the screw on the scale indicator. See Figure 23.
- Adjust the front rail until the 2 in. mark is placed at the scale indicator. Align the rear rail to the front rail.
- Tighten the screw and check the dimension and the rip fence.

WARNING:

Blades coast after turn off. Possible serious injury can occur if hands come in contact with blade.

Fig. 20

Fig. 21

Fig. 22

OPERATION

TO USE OUTFEED SUPPORT

See Figure 24.

The outfeed support slides to give the operator additional support for cutting long workpieces.

- With the table saw in the off position, stand behind the saw.
- Grasp the outfeed support with both hands and pull the outfeed support until it is fully extended.

TO USE SOLID TABLE EXTENSION

See Figure 25.

The solid table extension provides the operator with a flat surface.

- Remove the sliding miter table by turning the table lock knobs counterclockwise.
- Place the solid table extension in the slot.
- Retighten the table lock knobs.

WARNING:

Never stand directly in line with the blade or allow hands to come closer than 3 in. to the blade. Do not reach over or across the blade. Failure to heed this warning can result in serious personal injury.

MAKING CUTS

The blade provided with your saw is a high-quality combination blade suitable for ripping and crosscut operations.

WARNING:

All blades must be rated for at least 5,500 RPM to prevent possible injury.

TO MAKE A CROSS CUT

See Figure 26.

WARNING:

Never use rip fence as cutoff gauge when crosscutting.

WARNING:

Make sure the blade guard assembly is installed and working properly to avoid serious personal injury.

Note: When the miter fence is placed in the first hole (one towards the center of the sliding miter table), use the scale on the outside of the sliding miter table. To increase cutting capacity, use the second hole (one closest to the front of the table), using the front of the miter fence to read the inner scale.

It is recommended you make test cuts on scrap wood.

- Remove the rip fence by lifting the locking handle.
- Set the blade to the correct depth for the workpiece.

Fig. 24

Fig. 25

Fig. 26

OPERATION

- Set the miter fence to 0° and tighten the lock knob.
- Place a support (the same height as saw table) behind the saw for the cut work.
- Make sure the wood is clear of the blade before turning on the saw.
- To turn the saw on (△), lift the switch button.
- To turn saw off (▽), press the switch button down.

Note: To prevent unauthorized use, remove the switch key as shown in figure 27.

- Let the blade build up to full speed before moving the workpiece into the blade.
- Hold the workpiece firmly with both hands on the miter fence and feed the workpiece into the blade.
- When the cut is made, turn the saw off (▽). Wait for the blade to come to a complete stop before removing the workpiece.

TO MAKE A MITER CUT

See Figure 28.

It is recommended you make test cuts on scrap wood.

WARNING:

Make sure the blade guard assembly is installed and working properly to avoid serious personal injury.

- Remove the rip fence by lifting the locking handle.
- Set the miter fence to the desired angle and tighten the lock knob.
- Place a support (the same height as saw table) behind the saw for the cut work.
- Make sure the wood is clear of the blade before turning on the saw.
- Let the blade build up to full speed before moving the workpiece into the blade.
- Feed the workpiece into the blade until the cut has been completed.

TO MAKE A STRAIGHT RIP CUT

See Figure 29.

It is recommended you make a test cut on scrap wood.

WARNING:

Make sure the blade guard assembly is installed and working properly to avoid serious personal injury.

- Position the rip fence the desired distance from the blade for the cut and securely lock the handle. Adjust the scale to zero at the cutting edge of the blade.
- Place a support (the same height as saw table) behind the saw for the cut work.
- Make sure the wood is clear of the blade before turning on the saw.
- Use a push block or push stick to move the wood through the cut past the blade. **Never push a small piece of wood into the blade with your hand, always use a push stick.** The use of push blocks, push sticks, and featherboards are necessary when making non-through cuts.

- Stand to the side of the wood as it contacts the blade to reduce the chance of injury should kickback occur. **Never stand directly in the line of cut.**
- Make sure the wood is clear of the blade before turning on the saw.
- Let the blade build up to full speed before feeding the workpiece into the blade.
- When the cut is made, turn the saw off (▽). Wait for the blade to come to a complete stop before removing the workpiece.

SWITCH IN LOCKED POSITION

Fig. 27

Fig. 28

Fig. 29

OPERATION

TO MAKE A BEVEL CROSS CUT

See Figure 30.

It is recommended that you place the piece to be saved on the left side of the blade and that you make a test cut on scrap wood.

WARNING:

Make sure the blade guard assembly is installed and working properly to avoid serious personal injury.

- Remove the rip fence by lifting the locking handle.
- Unlock the bevel locking lever.
- Turn the bevel handle until the bevel indicator is at the desired angle. Press the bevel locking lever towards the table saw to lock.
- Set the blade to the correct depth for the workpiece.
- Set the miter fence to 90°.
- Place a support (the same height as saw table) behind the saw for the cut work.
- Make sure the wood is clear of the blade before turning on the saw.
- Let the saw blade build up to full speed before moving the miter fence and the workpiece into the blade.
- Hold the workpiece firmly with both hands on the miter fence and feed the workpiece into the blade.
- When the cut is made, turn the saw off (). Wait for the blade to come to a complete stop before removing the workpiece.

TO MAKE A BEVEL RIP CUT

See Figure 31.

It is recommended you make test cuts on scrap wood.

WARNING:

The rip fence must be on the left side of the blade to avoid trapping the wood and causing kickback.

WARNING:

Make sure the blade guard assembly is installed and working properly to reduce the risk of serious personal injury.

- Remove the miter fence.
- Position the rip fence the desired distance from the left side of the blade and lock down the handle.
- Adjust the bevel angle to the desired setting.
- Set the blade to the correct depth.
- If ripping a piece larger than 36 in. long, place a support the same height as the table surface behind the saw for the cut work.

Fig. 30

Fig. 31

- Turn the power switch to the on () position.
- Position the workpiece flat on the table with the edge flush against the rip fence. Let the blade build up to full speed before feeding the workpiece into the blade.
- Using a push stick and/or push blocks, slowly feed the workpiece toward the blade. Stand slightly to the side of the wood as it contacts the blade to reduce the chance of injury should kickback occur.
- Once the blade has made contact with the workpiece, use the hand closest to the rip fence to guide it. Make sure the edge of the workpiece remains in solid contact with both the rip fence and the surface of the table. If ripping a narrow piece, use a push stick to move the piece through the cut and past the blade.
- When the cut is made, turn the saw off (). Wait for the blade to come to a complete stop before removing the workpiece.
- After the blade has stopped completely, remove the cutoff stock.
- Grasp the workpiece from the lead end (the end fed into the blade first) and carefully remove it from the table.

OPERATION

TO MAKE A COMPOUND MITER CUT

It is recommended that you place the piece to be saved on the left side of the blade and that you make a test cut on scrap wood first.

WARNING:

Make sure the blade guard assembly is securely installed and working properly to avoid serious personal injury.

- Remove the rip fence by lifting the lock down handle.
- Unlock the bevel locking lever.
- Adjust the bevel angle to the desired setting.
- Lock the bevel locking lever.
- Set the saw blade to the correct depth.
- Loosen the lock knob on the miter fence, set the miter fence to the desired angle and tighten lock knob.
- Turn the power switch to the on (⏻) position.
- Position the workpiece flat on the table with the edge flush against the miter fence. Let the blade build up to full speed before feeding the workpiece into the blade.
- Advance the workpiece and the miter fence toward the blade. Keep the workpiece flush against the miter fence. Push the miter fence and workpiece toward the blade. Stand slightly to the side of the wood as it contacts the blade to reduce the chance of injury should kickback occur.
- When the cut is made, turn the saw off (⏻). Wait for the blade to come to a complete stop before removing the workpiece.
- After the blade has stopped completely, remove the cutoff stock.

TO MAKE NON-THROUGH CUTS

Non-through cuts can be made with the grain (ripping) or across the grain (crosscut). The use of a non-through cut is essential to cutting grooves, rabbets, and dadoes. This is the only type cut that is made without the blade guard installed. Make sure the blade guard assembly is reinstalled upon completion of this type of cut. Read the appropriate section which describes the type of cut in addition to this section on non-through or dado cuts. For example, if your non-through cut is a straight cross cut, read and understand the section on straight cross cuts before proceeding.

WARNING:

Unplug the saw to avoid possible injury.

- Lower the blade.
- Loosen the two hex nuts at the base of the riving knife. **Do not remove hex nuts.** Remove the riving knife/guard assembly. Retighten the two hex nuts on the base.

- Raise the blade to the correct height by turning the blade adjusting handle counterclockwise.
- Feed the workpiece into the blade.

WARNING:

Carefully check all setups and rotate the blade one full revolution to assure proper clearance before connecting saw to power source.

- Always use push blocks, push sticks, and featherboards when making non-through cuts to avoid the risk of serious injury. *See Figure 32.*

WARNING:

When making a non-through cut, the cutter is covered by the workpiece during most of the cut. Be alert to the exposed cutter at the start and finish of every cut to avoid the risk of serious personal injury.

OPERATION

WARNING:

Never feed wood with your hands when making any non-through cut such as rabbets or dados.

WARNING:

When making a non-through cut, the cutter is covered by the workpiece during most of the cut. Be alert to the exposed cutter at the start and finish of every cut to avoid the risk of serious personal injury.

- When the cut is made, turn the saw off (). Wait for the blade to come to a complete stop before removing the workpiece.
- Unplug your saw.
- Lower the saw blade.
- Reinstall the blade guard assembly.
- Retighten the nuts at the base of the riving knife. Check riving knife alignment to the blade.

TO MAKE DADO CUTS

A dado is a non-through cut and typically refers to a channel cut, both with the grain and across the grain. (The Ryobi part number for the dado set is 4650306.)

- Unplug your saw.

WARNING:

Unplug the saw to avoid possible injury.

- Lower the blade.
- Remove the blade guard assembly.
- Retighten the two hex nuts on base assembly.
- Remove the throat plate.
- Remove the saw blade.
- Remove the flange/spacer and spacer/washer.
- Reinstall the flange/spacer.
- Mount the dado blade, using the blade and chippers appropriate for the desired width of cut.
- Reinstall the flange nut.
- Make sure the flange nut is fully engaged.
NOTE: the spacer/washer should only be used with a regular blade.
- Replace the throat plate with optional Dado Throat Plate (#0131030330-35). When ordering parts, always give the model number. Call 1-800-525-2579 for assistance.

WARNING:

Always put all spacers in proper location when changing back to saw blade. Failure to do so may result in possible injury and damage to the tool.

WARNING:

Always use push blocks, push sticks, or featherboards when making dado cuts to avoid the risk of serious injury.

WARNING:

All blades must be rated for at least 5,500 RPM to prevent possible injury or damage to the tool.

ADJUSTMENTS

REMOVING/REPLACING THE THROAT PLATE

See Figure 33.

WARNING:

Make sure the switch is off and the plug is out of the outlet. Failure to do so could result in accidental starting, resulting in serious personal injury.

WARNING:

Drop blade below saw table when reinstalling the throat plate. Failure to heed this warning could result in serious personal injury.

- To remove the throat plate, first lower the blade and remove the screws holding the throat plate with a phillips screwdriver.
- Lift the the throat plate.
- To reinstall the throat plate, drop blade below saw table and place throat plate in the opening.
- Insert the throat plate screws and securely tighten.

TO CHECK THE ALIGNMENT OF THE RIP FENCE TO THE BLADE

See Figure 34.

WARNING:

Before performing any adjustment, make sure the tool is unplugged from the power supply and the switch is in the OFF position. Failure to heed this warning could result in serious personal injury.

- Raise the locking handle to permit the rip fence to be moved.
- Place a framing square beside the blade and move the rip fence up to the square. Take the dimension on the rip scale.
- Move the fence back and turn the framing square 180° to check the other side.
- If the two dimensions are not the same, loosen the two screws on the fence and align it.
- Retighten the two screws.
- Make two or three test cuts on scrap wood. If the cuts are not true, repeat the process.

WARNING:

Before plugging the saw back in to make test cuts, make sure the switch is in the OFF position and the blade guard is in place. Failure to do so may result in serious injury.

Fig. 33

Fig. 34

ADJUSTMENTS

TO REMOVE THE BLADE

See Figures 35 - 37.

Use the two wrenches supplied with the saw in this procedure to replace the blade.

WARNING:

Unplug your saw and make sure the blade guard assembly is installed and working properly to avoid serious personal injury.

- Lower the blade and raise the blade guard.
- Remove the screws from the throat plate then remove the throat plate.
- Raise the blade to its full height by turning the blade adjusting handle counterclockwise.
- Place the open end of the small hex wrench into the slot beside the blade. The wrench will fit over two flats on the flange/spacer. See Figure 36.
- Fit the large hex wrench onto the flange nut. Turn clockwise and remove the flange nut, taking care not to drag your knuckles across the blade.

Note: The flange nut has right-hand threads.

- Remove the flange nut from the arbor and then remove the blade. Make sure the flange/spacer and spacer/washer are tight against arbor shoulder.
- Replace with a new blade. Make sure the blade teeth are pointing forward, toward incoming work.
- Put the flange nut back on. Tighten the nut with a clockwise turn.

Note: Use care not to cross thread flange nut. Do not overtighten.

- Rotate the blade by hand to make sure it is turning freely.
- Check the riving knife and adjust if needed (see next procedure).
- Lower the blade, insert the throat plate, then securely tighten the throat plate screw.

Fig. 35

Fig. 36

Fig. 37

ADJUSTMENTS

ALIGNING SPREADER WITH THE BLADE

See Figures 38 - 39.

WARNING:

Failure to turn the table saw off, remove the switch key, and unplug the saw before servicing or working on it could result in accidental starting causing possible serious injury.

WARNING:

It is important to install and adjust the spreader correctly. Poor alignment could cause kickback and throw the workpiece at the operator.

The spreader must be aligned with and centered over the blade.

- Raise the blade and the blade guard.
- Place a framing square or straight edge beside the blade on the left. See Figure 38.
- Loosen nut on the spreader with an adjustable wrench.

WARNING:

Do not loosen the screws holding the spreader to the blade guard bracket. Unsecured pawls or spreader could cause personal injury while you are adjusting the spreader.

- Center the spreader over the blade. See Figure 39.
- Securely tighten nut.

Fig. 38

VIEWED FROM TOP OF SAW WITH SPREADER SHOWN CENTERED OVER BLADE

Fig. 39

ADJUSTMENTS

WARNING:

Before performing any adjustment, make sure the tool is unplugged from the power supply and the switch is in the off (⏻) position. Failure to heed this warning could result in serious personal injury.

TO SET BLADE AT 0° OR 45°

See Figure 40.

The angle settings of your saw have been set at the factory and, unless damaged in shipping, should not require setting during assembly. After extensive use, it may need to be checked.

- Raise the blade and the blade guard.
- If the blade is not perfectly vertical (0°), loosen the adjustment bolt and the bevel locking lever.
- Place a framing square beside the blade on the left. Lock the angle by pushing the bevel locking lever and retighten the adjustment bolt.
- Adjust the bevel indicator to zero.
- If the blade is not an exact 45°, loosen the adjustment bolt and the bevel locking lever.
- Turn the bevel handle until the bottom of the blade has moved completely to the left side of the slot. Lock the angle by pushing the bevel locking lever.
- If the blade is not an exact 45°, loosen the adjustment bolt and the bevel locking lever.
- Adjust the bevel indicator to 45°.
- Make a test cut.

Fig. 40

ADJUSTMENTS

TO ADJUST THE SLIDING MITER TABLE ASSEMBLY

The sliding miter table assembly has been preset at the factory to be parallel to the blade. However, misalignment during shipping or requirements for very precise and accurate cuts may require realignment. The square relationship between the blade and the miter fence as it travels the entire distance from the front to the rear of the miter table base during a cut is very important for making precise and accurate cuts.

To avoid unnecessary setups and adjustments, we suggest that you check these setups carefully with a framing square and make practice cuts in scrap wood before making finish cuts in good workpieces.

Note: Follow the general rule of measuring twice and cutting once.

Do not loosen any screws for the following adjustments until you have made checks and are sure adjustments are needed. Once screws have been loosened, these settings must be reset.

Two basic checks should be made to determine if adjustments are necessary:

- The miter base must be parallel to the blade as the table slides from the front to the rear of the miter table assembly.
- The miter fence must be square to the blade when set at exactly zero (0°) on the miter table scale. This is necessary in order to be able to use the scale on the miter table. The miter table has adjustment screws for squaring miter fence to blade and maintaining 0° scale settings when miter base adjustments are required.

Note: These checks and adjustments are being explained in step by step procedures, however, you should be aware that they depend upon each other.

ADJUSTMENTS

CHECKING SLIDING MITER TABLE ASSEMBLY

To Check Miter Base Parallelism:

WARNING:

Begin by unplugging your saw. Failure to unplug saw could result in accidental starting causing possible serious injury.

- Slide miter table to the front of miter base as far as it will go. Place a reference mark (A) near the end of the miter table as shown in figure 41.

Note: Front of miter base is on infeed side of saw.

- Place a reference mark on one of the blade teeth (B) and rotate the blade (C) so that the reference mark on the blade is at the front of the throat plate (D).
- Place a framing square (E) against the blade and align with reference mark on miter table. Measure the distance between the blade and the edge of miter table.

Note: Place framing square between carbide teeth and measure from blade. This step will insure framing square is square against blade from the front to back of blade.

- Remove framing square and slide miter table to the rear of miter base as far as it will go. *See Figure 42.*
- Rotate the blade so the reference mark on the blade is at the rear of the throat plate. Measuring from the same mark on the blade at the rear will eliminate the effect of blade wobble.
- Place framing square against the blade and align with the same reference mark on the miter table. Measure the distance between the blade and the edge of the miter table at the rear.
- Compare whether the front and rear measurements are the same. If they are the same, proceed with checking the miter fence alignment. If not, this indicates the miter base needs aligning. Miter base must then be adjusted before checking miter fence alignment. See **To Adjust the Miter Base** section that follows.

Fig. 41

Fig. 42

ADJUSTMENTS

To Check Miter Fence Alignment

See Figure 43.

The miter fence must be perpendicular to the blade when set at zero degrees.

WARNING:

Begin by unplugging your saw. Failure to unplug saw could result in accidental starting causing possible serious injury.

- Set the miter fence (H) at 0° as shown in figure 43. Miter indicator (I) should be set precisely on 0° and secured in place with adjusting clamp (F).
- **Note:** The quick-stop is not necessary for this checking procedure. However, you may want to check and adjust it to 0° at this time. See *Quick-Stop* section that follows.
- Place a framing square (E) firmly against the miter fence (H) with the other side against the blade (C).
- Check whether the miter fence and blade are square with each other. With the framing square against the miter fence there should be no gap from the front to the rear of the blade.
- If a gap exists, the miter fence may be out of square.
- Rotate the blade and recheck. If there is a consistent gap between the front and rear of the blade, the miter table needs aligning. Follow the adjustment procedures that follow.

MAKING ADJUSTMENTS TO SLIDING MITER TABLE ASSEMBLY

To Adjust the Miter Table

See Figure 44.

The sliding miter table has been set at the factory and, unless damaged in shipping, should not require setting during assembly. After extensive use, it may need to be checked.

REMEMBER: Check all settings before loosening screws for the following procedures. Once screws have been loosened, these settings must be reset.

- Four screws secure the sliding miter table to the table base.
- Two screws (K) are used to adjust the sliding miter table parallelism.
- Loosen the two screws (K), as shown in figure 44, to adjust fence squareness and miter table parallelism.
- Follow the steps in **To Check Miter Base Parallelism**, adjust the miter base so that it is parallel to the blade.

Fig. 43

Fig. 44

ADJUSTMENTS

WARNING:

Begin by unplugging your saw. Failure to unplug saw could result in accidental starting causing possible serious injury.

TO ADJUST THE MITER FENCE

- Set the miter fence (H) at 0° as shown in figure 46. Miter indicator (I) should be set precisely on 0° and secured in place with adjusting clamp (F).
- There are four slides located under the sliding miter table. These slides let the miter table move on the base. Three slides are mounted on eccentric screws that can be adjusted by loosening the hex nuts on top of the miter table. See Figure 45.
- Loosen the rear hex nuts (K) on top of sliding miter table for this adjustment procedure.
Note: The front screws are only needed to remove excessive play in the slides due to wear from extended use. They are **not** needed for this procedure. The right front hex nut is a non-eccentric pivot and should never be loosened.
- Adjust the right rear eccentric screw from the lower side of the miter table so that maximum play exists between the slide and miter base.
- Push left rear of miter table snugly against miter base as shown by the arrow (M) in figure 46 and secure.
- Place a framing square firmly against the miter fence, with the other side against the blade.
- Adjust left rear screw from underneath miter table until miter fence and blade are square with each other.
- Tighten hex nut securely.
- Adjust right rear screw from underneath miter table to remove excessive play.
- Tighten hex nut securely.
- Recheck your setups carefully. Also make sure all screws, hex nuts, etc. have been tightened securely.
- If sliding miter table assembly is still not square with the blade, repeat the above procedures as needed.
- Make sure that slides remain square to miter base edge to prevent “cocking” which will result in excessive play in miter table.

TO ADJUST QUICK-STOP

The quick-stop is preset at the factory to stop the miter fence at exactly 0°. However, when sliding miter table adjustments are made, these adjustments may cause the quick stop to need adjusting. Check quick-stop with miter scale set at 0°. If adjustments are needed, proceed with the following steps:

- Loosen the eccentric screw holding the quick-stop.
- Place the quick-stop against the miter fence with miter scale set at 0°. See Figure 47.
- Adjust eccentric screw until it holds quick-stop securely against miter fence.
- Retighten hex nut, securing eccentric screw and quick-stop.
- Check your work. If the quick-stop is not at 0°, repeat above steps.

Fig. 45

Fig. 46

Fig. 47

MAINTENANCE

GENERAL MAINTENANCE

WARNING:

Always begin by disconnecting the power supply.

- Periodically check all clamps, nuts, bolts, screws, and belts for tightness and condition. Make sure the throat plate is in good condition and in position.
- Check the blade guard assembly.
- To maintain the table surfaces, fence, and rails, periodically apply paste wax to them and buff to provide smooth functioning.
- Protect the blade by cleaning out sawdust from underneath the table and in the blade teeth. Use a resin solvent on the blade teeth.
- **Clean plastic parts only with a soft damp cloth. DO NOT** use any aerosol or petroleum solvents.

LUBRICATION

This saw has been lubricated at the factory prior to shipment. Following extended use, you should inspect and lubricate the following areas to assure smooth operation.

TILT / ELEVATING MECHANISM

- Add dry lube between the handle shaft and the bore of the clamping bolt.
- Add dry lube between the face of the clamping bolt and the face of the handle shaft.
- Add dry lube on the inner surfaces of the bevel locking lever which contacts the cam.

BLADE AND BLADE WRENCH STORAGE

See Figure 48.

Your table saw has a convenient storage area specifically designed for holding blades and blade wrenches. Remove the knob and slide the blade and blade wrenches over the bolt. Retighten the knob.

MITER FENCE AND RIP FENCE STORAGE

See Figure 49.

Your table saw has a convenient storage area specifically designed for your miter fence and rip fence. Simply snap the fence in place to hold it securely.

EXTENSION CORD CAUTION

When using a power tool at a considerable distance from a power source, be sure to use an extension cord that has the capacity to handle the current the tool will draw. An undersized cord will cause a drop in line voltage, resulting in overheating and loss of power. Use the chart to determine the minimum wire size required in an extension cord. Only round jacketed cords should be used.

When working with a tool outdoors, use an extension cord that is designed for outside use. This is indicated by the letters "WA" on the cord's jacket.

Before using any extension cord, inspect it for loose or exposed wires and cut or worn insulation.

**Ampere rating

(on tool data plate) 0-2.0 2.1-3.4 3.5-5.0 5.1-7.0 7.1-12.0 12.1-16.0

Cord Length	Wire Size (A.W.G.)					
25'	16	16	16	16	14	14
50'	16	16	16	14	14	12
100'	16	16	14	12	10	—

⚠ CAUTION: Keep the extension cord clear of the working area. Position the cord so that it will not get caught on workpiece, tools, or other obstructions while you are working with a power tool.

***Used on 12 gauge - 20 amp circuit.*

• SERVICE

Now that you have purchased your tool, should a need ever exist for repair parts or service, simply contact your nearest Ryobi Authorized Service Center. Be sure to provide all pertinent facts when you call or visit. Please call 1-800-525-2579 for your nearest Ryobi Authorized Service Center. You can also check our web site at www.ryobitools.com for a complete list of Authorized Service Centers.

• MODEL NO.

The model and serial numbers of your tool will be found on the data plate attached to the tool. Please record the serial number in the space provided below.

- MODEL NUMBER BTS15
- SERIAL NUMBER _____
